

The tables in the DataBase.

This is the structure of the database. The Orchestra and Musician tables have a one-to-many relationship with each other.

A musician can only belong to one orchestra, but an orchestra can have many musicians.

The OrchestraMusician table has a many-to-many relationship with both Musician and Orchestra, and serves to normalize these two tables.

-This is the project structure, including hibernate.cfg.xml, a file that provides the configuration to access the database and map the entities.

Package APP contains the main application. Package Controller includes Data Access Object classes for creating, reading, updating, and deleting. Package Model contains entities for the database. Package ORM includes a class that obtains sessions and accesses the database through the hibernate.cfg.xml file.

Firstly, in your database management system, execute the script provided in the project, database.sql.

Afterward, run the application from the main, and proceed from the menu.
